Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 11.614; Variance 5.488; scale 2.116

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 34.824; Variance 168.421; scale 0.207

Example 7; Pages 98-99; 130pp; English.
The present sequence is human C-C chemokine receptor 3 (CRK3), to which human eotaxin (hE), an eosinophil specific chemoattractant capable of stimulating eosinophil accumulation and/or attracting eosinophils (including chemotaxis), binds.

hE can be used to develop products for the diagnosis, prevention or treatment of hE associated diseases or conditions. The products can be used to treat inflammatory or allergic diseases and conditions, including chemotaxis, including c

This is a human eosinophil eotaxin receptor. The 5099 base pair encoding CDNA sequence comprises a 1065 base pair open reading frame encoding this 355 amino acid eosinophil eotaxin receptor protein, flanked by a 5' genomic DNA sequence and a 3' terminator region. This novel eosinophil eotaxin receptor designated CC CKR3.

Agents which bind to this eosinophil eotaxin receptor can be used for the treatment and prevention of atopic conditions such as allergic rhinitis, dermanitis, conjunctivitis and bronchial asthma. Agents which bind to this eosinophil eotaxin receptor can be used to prevent viral confection in healthy individuals and slow or halt viral progression

New nucleic acid encoding chemokine receptors 88-2B and 88C - used to modulate leukocyte trafficking, e.g. for treatment of to modulate leukocyte trafficking, e.g. for treatment of for treatment of the ministration, tumours, viral infections, autoimmune diseases, etc. claim 1; Page 50-51; 65pp; English.

Statis polypeptide sequence comprises novel human chemokine receptor that is involved in leukocyte trafficking. Its amino sequence was deduced from a cDNA clone trafficking. Its amino sequence was deduced from a cDNA clone trafficking. Its amino sequence was deduced from a cDNA clone coccent. Chemokine receptor 88C (see W27123) has also been dentified. 88C and 88-2B receptors and their polypeptide fragments of coccent seproduced in transformed host cells. The receptors, peptides comprising one or more of the extracellular or intracellular comprising one or more of the extracellular or intracellular comprising one or more of the extracellular or intracellular creeptor activities, particularly ligand and did protein binding, and are potentially potentially useful in the treatment of are potentially potentially useful in the treatment of are potentially potentially useful in the treatment of infection, AIDS, inflammatory conditions, pathological immune response, absormal haematopoietic processes etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       121 iffiilltidrylaivhavfalrartvtfgvitsivtwglavlaalpefifyeteelfee 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mammalian chemokine receptor-3 and related nucleic acids - useful to identify receptor inhibitors to treat inflammatory disease, e.g. autoimmune disorders, certain cancers, etc.

Claim 10; Page 113-114; 133pp; English.

A novel human receptor (W03377), designated Eos L2 or C-C chemokine receptor 3 (CRR-3), is involved in leukcyct migration associated with inflammation. Its sequence was deduced from a cubh clone (T31335) isolated from a hyper-eosinophilic syndrome patient. A spenomic clone (T3134) and a consensus sequence is given in W03378. Recombinant CRR-3 can be produced in host cells, and is useful for inhibitors can be used to treat inflammatory disease.

New isolated chemokine CCF8 and chemokine receptor CCKR3 - used to develop products useful for the diagnosis and treatment of conditions associated with abnormal physiology or development Claim 15; Page 60-62; 73pp; Bnglish.

This is the amino acid sequence of a novel CCKR3 chemokine receptor Isolated from a Th0-activated human T-cell CDMA library using the sequence amplified by primers T79097 and T79098 as a probe.

The encoded protein can be used to screen for (ant)agonists that bind to the novel CCF18 chemokines (W25941 and W25942). These (ant)agonists are useful in the treatment of conditions associated with abnormal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              181 TLCSALYPEDTVYSWRHFHTLRMTIFCLVLPLLVMAICYTGIIKTLLRCPSKKKKKARIRL 240

MIP-1alpha and RANTES receptor nucleic acid - used to develop products for the detection of these cytokine(s) and their receptors, products for the detection of these cytokine(s) and their receptors. The particularly in inflammatory processes claim 2: Column 15-18; 12pp; English.

This polypeptide comprises a claimed receptor for human macrophage inflammatory protein-1 alpha (MIP-1 alpha) and regulated upon cutivation normal Texpressed and Secreted (RANTES) protein. Also claimed are: a nucleic acid (see T90384) that encodes the receptor; a subsequence of the nucleic acid, having at least 12 contiguous nucleotides; a cell transformed or transfected with the nucleic acid; and purified MIP-1 alpha/RANTES receptor polypeptide. The conducts can be used for detecting the MIP-1 alpha/RANTES in and polymorphisms in physiological samples. In addition, the receptor can be expressed and used to assay for MIP-1afARANTES is creceptor and perspecsed and used to assay for MIP-1afARANTES is useful for monitoring the levels of these cytokines in a patient. Such measurements are useful in following the antilnfilammatory and appropriate and processed and useful in following the antilnfilammatory.
                                                                                                                                                                                                                                                                                                    59 lvqykriknmtsiyllnlaisdllflftlpfwidyklkddwvfgdamckilsgfyytgly 118

Claim 10: Page 115-116; 153pp; English.
A consensus amino acid sequence (W03378) was produced for a novel human receptor, designated Eos L2 or C-c chemokine receptor 2 (CKR-3). It was obtd. by comparing the sequences (W03376-77) deduced from a CKR-3 genomic clone (71334) and a cDNA clone (731335). Initial sequence information revealed 2 regions in which the cDNA sequence appeared to be shifted in frame, resulting in 2 sets of 4 contiguous amino acid differences in the predicted proteins. Further sequence analysis revealed only a single difference between the 2 open reading frames, the genomic clone coding for threonine at position Sequence 355 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              241 IFVIMAVFFIEWTPYNVAILLSSYQSILFGNDCERTKHLDLVMLVTEVIAYSHCCMNPVI 300

Human MIP-lalpha/RANTES receptor protein.
Human MIP-lalpha/RANTES receptor; osteoporosis; pcCR; digestive ulcer;
macrophage inflammatory protein 1 alpha; diabetes; central disease;
regulated on activation, normal T cell expressed and secreted; allergy;
affinity compound; expression vector; CHO cell; viral disease;
infectious disease; tumour; hyperlipidaemia; hypercholesterolaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents here.

Inflammatory protein 1 alpha/regulated on activation, normal T cell
expressed and secreted). The human MIP-1 alpha/RANTES receptor protein
may be used in a method for the screening of human MIP-1 alpha/RANTES
receptor affinity compounds. The MIP-1 alpha/RANTES receptor coding
sequence may be included in an expression vector, preferably pCCR, and
used to transform a CHO cell for use in the same method. The receptor
protein can provide a preventive and treating agent for viral diseases,
infectious diseases, tumours, allergy, diabetes, central diseases,
hyperlipidaemia, hypercholesterolaemia, osteoporosis, digestive ulcers,

                                                                                                                                                                                                                                                                         domains, and anti-receptor antibodies can be used to modulate receptor activities, particularly ligand and G protein binding, and are potentially potentially useful in the treatment of atheroslerosis, rheumatoid arthritis, tumours, asthma, viral infection, ADES, inflammatory conditions, pathological immune response, abnormal haematopoietic processes etc. A hybridoma that produces an antibody that specifically binds to macaque 88C is
                                                                                                                                                                                       a G protein coupled receptor that is involved in leukocyte trafficking. Its amino sequence was deduced from a 88C DNA (T85163) isolated by PCR amplification. It shows 97% identity to human 88C (W27123). 88C receptors and their polypeptide fragments can be produced in transformed host cells. The receptors, peptides comprising one or more of the extracellular or intracellular

New nucleic acid encoding chemokine receptors 88-2B and 88C - used to modulate leukocyte trafficking, e.g. for treatment of inflammation, tumours, viral infections, autoimmune diseases, etc. Claim 16; Page 47-48; 65pp; English.

This polypeptide sequence comprises novel human chemokine receptor This polypeptide sequence comprises novel human chemokine receptor (T85161) isolated from a macrophage library. It shows 62% identity CC trafficking. Its amino sequence was deduced from a CDNA clone (T85161) isolated from a macrophage library. It shows 62% identity CC to CCCKRI. Chemokine receptor 88-2B (see W2712A) has also been identified. 88C and 88-2B (see W2712A) has also been comprising one or more of the extracellular or intracellular comprising one or more of the extracellular or intracellular comprising one or more of the extracellular or intracellular comprising one or more of the extracellular or intracellular creceptor activities, particularly ligand and G protein binding, and anti-receptor antibodies can be used to modulate creceptor activities, particularly ligand and G protein binding, and atteroslerosis, rheumatoid arthritis, tumours, asthma, viral infection, AIDS, inflammatory conditions, pathological immune response, abnormal haematopoietic processes etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             artvtfgvvtsvitwvvavfaslpgiiftrsqkeglhyt-csshfpysq-yqfwknfqtl 196

autofimmune disease and viral infection
claim 4: Fig 1b-c; 94pp; English.

The present sequence is human CC (Cys-Cys) chemokine receptor
The present sequence is human CC (Cys-Cys) chemokine receptor
CCRE5, which is stimulated by MIP-1 alpha, MIP-1 beta or RANTES
Chemokines, but not by monocyte chemoattractant protein 1 (MCP-1),
MCP-2, MCP-3, interleukine 8 (IL-8) or growth related gene product
clapha (GRO alpha) chemokines. Active CCR-5 is also a receptor of
chuman immunodeficiency virus type 1 or type 2 (HIV-1) or HIV-2).
CCRS or its cDNA can used to diagnose, treat and/or prevent
inflammatory diseases, e.g. rheumatoid arthritis,
glomerulonephritis, asthma, idiopathic pulmonary fibrosis and
cancer, atherosclerosis and autoimmune disorders.
